

East Park North East Corner

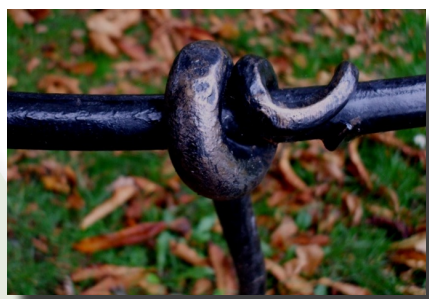

Recommend: Knee Rail

Foot traffic and cycles going to and from the Charlotte Place entrance has increased with further local development. This walk-off is under the canopies of Horse Chestnut trees. This compaction is detrimental to both the grass and the trees. Because of the proximity of the tree roots throughout this route, formalising the path is not an option due to the required depth of the sub base. Low knee rail would be the least intrusive intervention here. Suggest installing a rail around the terminal path end, and as a return at the entrance so as to guide path users to the existing macadam path.
