APPENDIX 1

2014/15 ECONOMIC BACKGROUND

Growth and Inflation: The robust pace of GDP growth of 3% in 2014 was underpinned by a buoyant services sector, supplemented by positive contributions from the production and construction sectors. Resurgent house prices, improved consumer confidence and healthy retail sales added to the positive outlook for the UK economy given the important role of the consumer in economic activity.

Annual CPI inflation fell to zero for the year to March 2015, down from 1.6% a year earlier. The key driver was the fall in the oil price (which fell to $44.35 a barrel a level not seen since March 2009) and a steep drop in wholesale energy prices with extra downward momentum coming from supermarket competition resulting in lower food prices. Bank of England Governor Mark Carney wrote an open letter to the Chancellor in February, explaining that the Bank expected CPI to temporarily turn negative but rebound around the end of 2015 as the lower prices dropped out of the annual rate calculation.

Labour Market: The UK labour market continued to improve and remains resilient across a broad base of measures including real rates of wage growth. January 2015 showed a headline employment rate of 73.3%, while the rate of unemployment fell to 5.7% from 7.2% a year earlier. Comparing the three months to January 2015 with a year earlier, employee pay increased by 1.8% including bonuses and by 1.6% excluding bonuses.

UK Monetary Policy: The Bank of England's MPC maintained interest rates at 0.5% and asset purchases (QE) at £375bn. Its members held a wide range of views on the response to zero CPI inflation, but just as the MPC was prepared to look past the temporary spikes in inflation to nearly 5% a few years ago, they felt it appropriate not to get panicked into response to the current low rate of inflation. The minutes of the MPC meetings reiterated the Committee's stance that the economic headwinds for the UK economy and the legacy of the financial crisis meant that increases in the Bank Rate would be gradual and limited, and below average historical levels.

Political uncertainty had a large bearing on market confidence this year. The possibility of Scottish independence was of concern to the financial markets, however this dissipated following the outcome of September's referendum. The risk of upheaval (the pledge to devolve extensive new powers to the Scottish parliament; English MPs in turn demanding separate laws for England) lingers on. The highly politicised March Budget heralded the start of a closely contested general election campaign and markets braced for yet another hung parliament.

On the continent, the European Central Bank lowered its official benchmark interest rate from 0.15% to 0.05% in September and the rate paid on commercial bank balances held with it was from -0.10% to -0.20%. The much-anticipated quantitative easing, which will expand the ECB's balance sheet by €1.1 trillion was finally announced by the central bank at its January meeting in an effort to steer the euro area away from deflation and invigorate its moribund economies. The size was at the high end of market expectations and it will involve buying €60bn of sovereign bonds, asset-backed securities and covered bonds a month commencing March 2015 through to September 2016. The possibility of a Greek exit from the Eurozone refused to subside given the clear frustrations that remained between its new government and its creditors.

The US economy rebounded strongly in 2014, employment growth was robust and there were early signs of wage pressures building, albeit from a low level. The Federal Reserve made no change to US policy rates. The central bank however continued with 'tapering', i.e. a reduction in asset purchases by $10 billion per month, and ended them altogether in October 2014. With the US economy resilient enough the weather the weakness of key trading partners and a strong US dollar, in March 2015 the Fed removed the word “patient” from its statement accompanying its rates decisions, effectively leaving the door open for a rise in rates later in the year.

Market reaction: From July, gilt yields were driven lower by a combination of factors: geo-political risks emanating from the Middle East and Ukraine, the slide towards deflation within the Eurozone and the big slide in the price of oil and its transmission though into lower prices globally. 5-, 10- and 20-year gilt yields fell to their lows in January (0.88%, 1.33% and 1.86% respectively) before ending the year higher at 1.19%, 1.57% and 2.14% respectively.
