# Introduction

- Behavioural risk factors are the largest contributor to the non-communicable disease burden
- Adolescence is a key timepoint to intervene\*

# #Tripledividend

## Health now

## Health in future

## Health for future children

# Secondary school programme

**‘Me, my health and my  
children’s health’**

# Me, My Health & My Children's Health

LifeLab developed as a **collaboration** by

- ❖ University of Southampton (Education and Medicine)
- ❖ NIHR Nutrition Biomedical Research Centre
- ❖ University Hospital Southampton
- ❖ Maths & Science Learning Centre South East
- ❖ MRC Lifecourse Epidemiology Unit

Supported by key stakeholders, particularly local authorities and schools

Located at University Hospital Southampton, comprising of a **seminar area** and a **laboratory** for hands-on experiments.

Programmes are tailored for students of **all abilities**, initially focusing on 12-14 year olds

# Educational intervention based on research evidence:

- **Education:**

Students need to understand the science behind health issues to make informed judgements about their health

- **Medical:**

A healthy lifestyle in early life

=

Better health in later life and for future generations

# LifeLab aims to provide school students with opportunities to:

Learn how they can improve their health and the health of their future children through increased health & science literacy

Become enthusiastic about science, and consider further study and careers in scientific disciplines

**THORNDEN SCHOOL**  
Visual Learning Environment

**REULTY**

We found out that, in comparison to the 'Ea' we had done in our class, it was very hard. As we had to do it in a group, it was hard to do it in a group. We found out that, in comparison to the 'Ea' we had done in our class, it was very hard. As we had to do it in a group, it was hard to do it in a group.

**CONCLUSION**

After looking back at our results, we discovered that we were wrong. We were wrong because we had not done it in a group. We were wrong because we had not done it in a group.

**Comparing Heart Rates**

**Cantell** Kelly, Toni, Carlyne, Lucy and Paloma  
Zak Cantell School Adam

**Introduction**

In this experiment we will be finding out how different speeds affect different people's heart rate. This experiment will have 4 testing's on 4 different people with 4 different diets. The tests will be on resting, jogging, running and skipping. Each test will be recorded 3 times to then find the end average of heart beats per minute.

**Results**

A graph to show the average the heart rates of different people when doing different exercises

**Conclusion**

The graph shows that as the speed of each activity increases so does the heart rate. This is because you need more blood pumped around your body to carry the oxygen. Even better if we included a food diary so we can record our health of each participant in the experiment. Also with each person we will have the same amount of food.

**Introduction**

In this experiment we will be finding out how different speeds affect different people's heart rate. This experiment will have 4 testing's on 4 different people with 4 different diets. The tests will be on resting, jogging, running and skipping. Each test will be recorded 3 times to then find the end average of heart beats per minute.

**Results**

A graph to show the average the heart rates of different people when doing different exercises

Activity	Person 1	Person 2	Person 3	Person 4
Resting	70	75	80	85
Jogging	110	115	120	125
Running	150	155	160	165
Skipping	180	185	190	195

**Conclusion**

The graph shows that as the speed of each activity increases so does the heart rate. This is because you need more blood pumped around your body to carry the oxygen. Even better if we included a food diary so we can record our health of each participant in the experiment. Also with each person we will have the same amount of food.

**Acknowledgements**

Life is full of challenges. We have to face them. We have to face them. We have to face them.

# LifeLab Research:

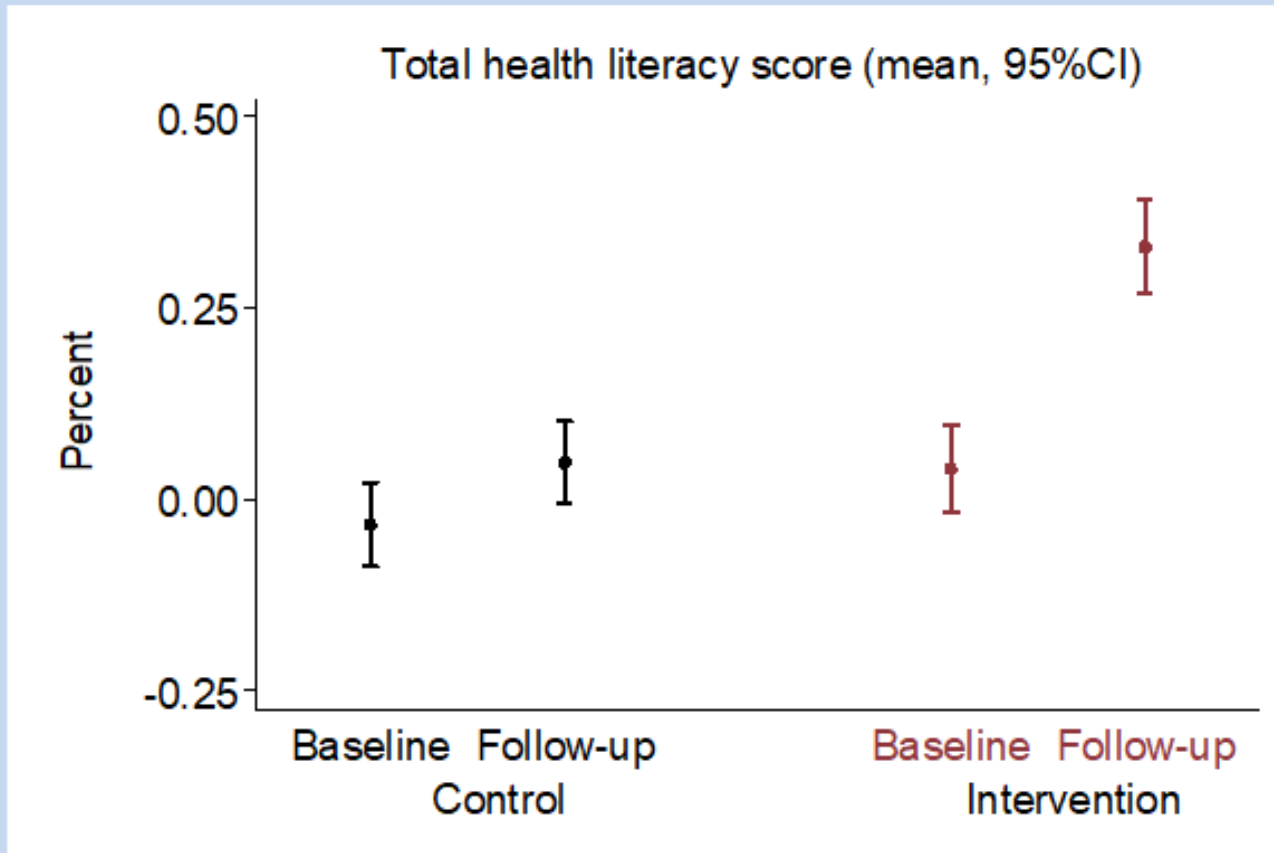

- 42 schools recruited and randomised to our randomised controlled trials (RCTs) (funded by the BUPA foundation and the British Heart Foundation)
- Currently recruiting for new NIHR funded RCT – ‘Engaging Adolescents with Changing Behaviour’ (EACH-B)
- To date, over 11,00 school students have attended
  - Primarily years 8/9, but also 11-18 yrs

# A lasting impression

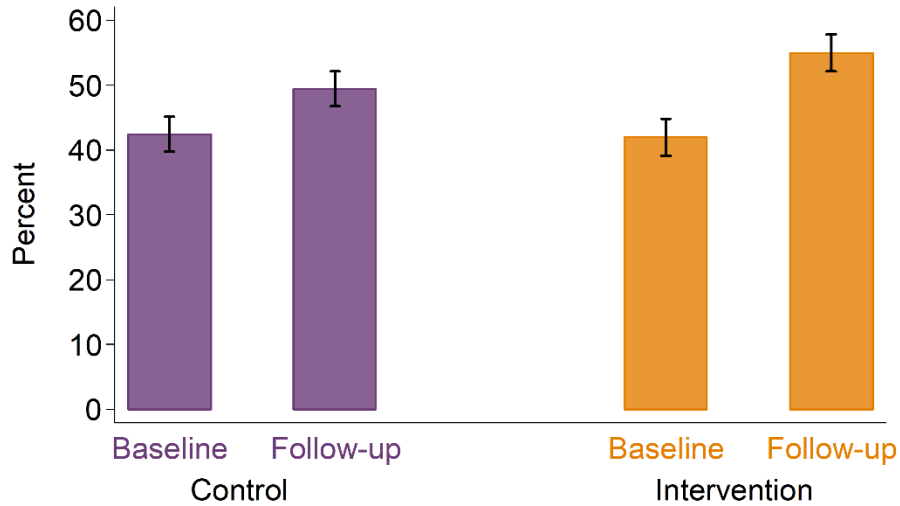

Our pilot studies have demonstrated important statistical changes in the attitudes of children 12 months after experiencing LifeLab.

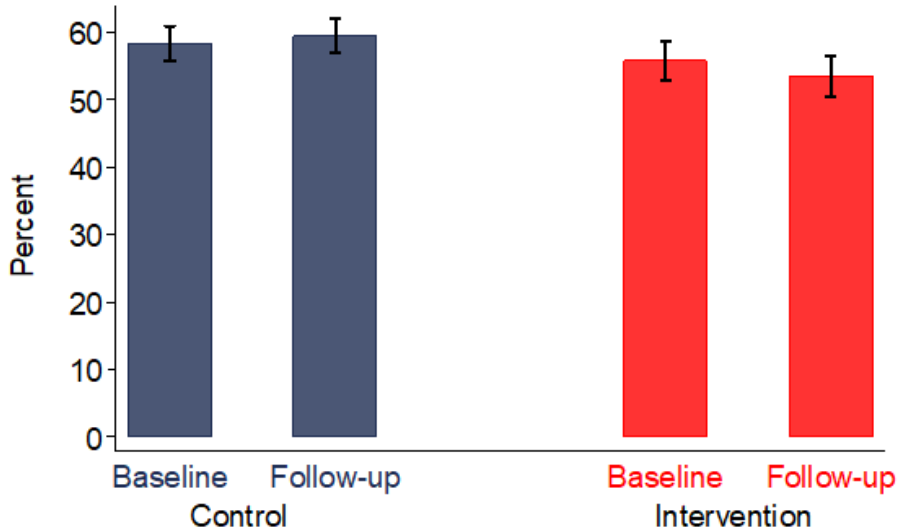

At what age do you think our nutrition starts to affect our future health? (Before birth)

Lifestyle reported as very healthy or healthy

There are certain things I can do to lower my risk of heart disease/cancer

“If I want to have a long healthy life I need to be more careful with my body and need to look after it more”

I think that the most important thing I had learnt was that I need to commit to keeping healthy because otherwise when I'm older it can really effect my health

“I won't eat as many unhealthy foods because I don't want to have heart disease.”

“When I went home and told my mum about the LifeLab programme she suggested that I start taking my German Shepherd out for a walk every day. So that's the change I've done”

“How unhealthy my lifestyle actually is and the small changes that need to be made just to make sure I'm at less off a risk.”

# Engaging Adolescents in Changing Behaviour (EACH-B)

**LifeLab behaviour change goals**  
13-14 year olds, n = 111

+

+

Programme Grant £2.2m

Funded by **NIHR**

# Young Health Champions

Level 2 Qualification (GCSE level)

Accredited by the Royal Society of Public Health

## 4 Modules

- Module 1 - LifeLab module
- Module 2 - Signpost to Health Improvement Resources
- Module 3 - Deliver a health improvement message to a group of peers
- Module 4 - Optional

- Health aspects of science curriculum
- Cross-curricular opportunities
- Parent engagement

# Conclusions

LifeLab programme engages adolescents leading to:

- sustained changes in health literacy
- more critical judgement of their health behaviour

Provides a route into schools for public health interventions

## Future priorities

- Repeated exposure (primary, secondary, tertiary)
- Additional support  
(Individual, school, family)
